

# Corkboards

## Maintenance Instructions

One of the reason that Corkboards is such an attractive alternative is that there is so little maintenance needed to keep the floor looking good for years. However, like any other floor, it does need some basic maintenance to keep it clean. Here are some recommended steps.

### Daily

Either vacuum or sweep the floor daily to remove any small debris that may cause the flooring to scratch, and to pick up dust.

### Weekly

A mixture of a mild, ph neutral detergent and water is all that you will need to clean the floor. This type of detergent is what we are familiar with when washing dishes by hand. Just ensure that the detergent is ph neutral, which is rated as ph7 on the label of the bottle. As you know, this detergent will cause a lot of foaming, so use only about an ounce and a half per gallon to make sure that the floor will not need to be rinsed afterwards.

There are two ways to mop the floor efficiently, but both require that the mop be damp and not wet. One is to use a string mop and soak it in the detergent mixture, and then wring it out thoroughly so that the mop is only damp. Another method is to soak towels in the detergent mixture, wring them out thoroughly and wrap them around a push broom.

The mixture should not be so soapy that you need to rinse the floor afterwards.

### Spills

Spills will not hurt Corkboards, but they should still be wiped up as soon as they are noticed because water on the surface of this material can cause it to become quite slippery.

Please feel free to call or email us with any questions that you have about maintaining your Corkboards flooring.
